// cross selected from Chinaties from various tissues and stages of development of soybean that represent 2,639 sequences from immature octyledons, 1,770
// from immature seed coats, 3,938 from flowers, and 869
// from immature seed coats, 3,938 from flowers, and 869
// from immature seed coats, 3,938 from flowers from the different libraries was used to select singletons, or a representative of each contig which were reracked to form library Gm-ri070. The coDNs clones of the reracked Gm-ri070 library were then sequenced at the 3' end. The contig analysis to select unique genes was performed by the the jaboratory of Enromed by Genomics and Bioinformatics, University of Minnesota, http://www.cbc.umn.edu/ResearchProjects/Soybean/index.html.
// Reacking was performed by Genome Systems, 5t. Louis, http://www.life.uluo.edu/NoresearchProjects/Soybean/index.html

subsequently phosphorylated. The XhoI site within the first-strand synthesis primer was then restricted by digestion with XhoI; all XhoI sites in the cDNA would be protected by their hemimethylated status. The cDNA constructs were size-fractionated with a 500bp cutoff, using GibcobRL Life Technologies' CDNA Size Fractionation column. The column eluent was then ligated into Stratagene's pBluescript II XR Predigested vector (pBluescript II SK(+) that has been digested with EcoRI and XhoI, and phosporylated by Stratagene'. Both the white and blue colonies appear to contain recombinant plasmids with cDNA inserts, based on size (n=25). This library was constructed by Dr. Paul Keim and Dr. Virginia Coryell."
                                                                                                                                                                                                                                                                                                                                                                                                                        ö

/note="Weetor: pBluescript II SK+; Site I: ECORI; Site_2:
Xhol; The CDNA library was constructed from floral
meristematic mRNA provided by Dr. Halina Knap of Clemson
University. Complementary DNA was synthesized from mRNA
using a primer consisting of a poly(dT) sequence with a
Xhol restriction site. ECORI adapters were ligated to the
blunt-ended cDNA fragments followed by Xhol digestion. The
CDNA fragments were directionally cloned into the
ECORI-Xhol restriction site of the pBluescript vector. The
ligated cDNA fragments were transformed into the
ligated cDNA fragments were transformed into the
ligated cDNA fragments were transformed into the
ligated cDNA fragments were transformed into the
ligated cDNA fragments were transformed into the
laboratory of Dr. Randy Shoemaker."

The library was prepared using the library was prepared using	construction kit Complementary NA was synthesized from mRNA using a poly (dT) sequence with a Not I restriction site. Sal I linker adapters were ligated to the	blunt-ended cDNA fragments followed by Not I digestion. The cDNA fragments were directionally cloned into the Not I-Sal I restriction site of the pSPORTI vector. The ligated cDNA fragments were transformed into E.coli

/note="Wector: Lambda Zap, cDNA was prepared from polyA+enried, pooled samples of equivalent amounts of total RNA from very young, developing, fully-opened flowers and flowers transitioning into pods. The cDNA was directionally ligated into the Uni-Zap RR vector (Stratagene) and packaged using the Gigapack II Gold packaging extracts. Phagemids containing cDNA inserts were using extasts helper phage and the E. coli strain XII-Blue MRR' (Stratagene). Excised plasmids were plated using SOLR cells."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    232
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          292

/note="Vector: unknown; Site 1: unknown; Ins Library is assigned to clones that are of uncertain origin due to an error during re-array, prepping, and/or analysis. Samples assigned this library are still genuine Glycine Max cDNA sequence, but we are unsure of its source and identification. Due to the clone id being incorrectly assigned, THESE CLONES ARE NOT AVAILABLE TO ONDER.
                                                                                                                                                                                                    1. (Jasses 1 to 422)

/clone_libs-gm-clo62"
/note=TVector: pBluescript II SK+; Site 1: EcoRI; Site 2:
XhoI; The cDNA library was constructed from mRNA isolated
from stem tissue of 1 month old greenhouse grown plants
for the cultivar Raiden. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with a XhoI restriction site. EcoRI
adapters were ligated to the blunt-ended cDNA fragments
followed by XhoI digestion. The CDNA fragments were
directionally cloned into the EcoRI-XhoI restriction site
of the pBluescript vector. The ligated cDNA fragments were
transformed into bHIOB host cells (GibcoBRL). This library
was constructed in the laboratory of Dr. Randy Shoemaker."

٦, Lee Falco SC, Famodu OO,

WPI; 2003-328651/31. N-PSDB; ABX93058. New tyrosine biosynthetic enzyme, chorismate dismutase, proteins and nucleic acids, useful for facilitating design and/or identifying inhibitors of those enzymes that may be used as herbicides and for producing antibodies.

Claim 11; Fig 1; 32pp; English.

The invention discloses isolated polynucleotides encoding chorismate mutase polypeptides. Aromatic amino acids must be included in the diets converted to anthranilate amino acid biosynthetic pathway chorismate is converted to anthranilate during tryptophan biosynthesis and is converted to prephenate, the branch point for tyrosine and phenylalanine biosynthesis. Chorismate mutase catalyses the conversion of chorismate to prephenate. Also disclosed are methods for selecting an isolated polynucleotide that affects the level of expression of a tyrosine

Preparing fine chemicals, particularly Vitamins E and K, useful as antioxidants e.g. in foods or medicine, by growing organisms with altered

9; Page 60-61; 74pp; German

Claim

antioxidants e.g. in foods or m shikimate biosynthesis pathway.

N-PSDB; ABA99613

This invention describes a novel method for the preparation of fine chemicals by culturing organisms in which the shikimate pathway has been altered relative to the wild type. The method involves a construct containing a plastid transit peptide, a chorismate mutase and/or containing a plastid transit peptide, a chorismate mutase and/or cortaining a plastid transit peptide, a chorismate mutase and/or cortaining a plastid transit peptide, a chorismate mutase and/or cortaining a plastid transition in plants. The method is used to produce chemicals, particularly Vitamins B or K and/or ubiquinone, useful e.g. as fat-soluble antioxidants (in feeds, pharmaceuticals and cosmetics), but also aromatic amino acids, salicylic or folic acid derivatives, companies with increased vitamin E contents have improved resistance to plants with increased vitamin E contents have improved resistance to shikimate pathway are useful as foods, fodder and in preparation of shikimate pathway are useful as foods, fodder and in preparation of processed foodbruffs: Transgenic plants with maltered content of desired chemicals, particularly tocopherols and/or tocotrienols. This sequence represents the Arabidopsis thaliana cytosolic chorismate mutase-2 protein used in the method of the invention

biosynthetic enzyme polypeptide in a host cell, obtaining a nucleic acid fragment encoding a tyrosine biosynthetic enzyme polypeptide and evaluating compounds for their ability to inhibit the activity of a tyrosine biosynthetic enzyme. The polypeptides can be used produce antibodies. Chorismate mutase and prephenate dehydrogenase are good targets for herbicides that will not affect animals, and oversypression of these enzymes may be used to increase the content of aromatic amino acid in food crops. The polypeptides may also be used to design and/or identify inhibitors of those enzymes that may be used to design and/or nucleic acids may be used to create transgenic plants, as probes for the genetic and physical mapping of the genes and as markers for traits
                                                                                                                                                                                                                                                                                                                                                                                                   SLVEFVVKNTEAIQAKAGRYKNPEENAFFPENLPPSIVPSYSFKOFLHPGAASININKSI 120

                                                                                                                                                                                         The invention relates to identifying target proteins (ABB90790-ABB94016) for harbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor off 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                   9

The invention discloses isolated polymucleotides encoding chorismate

mutase polypeptides. Aromatic amino acids must be included in the diets

of animals. In the aromatic amino acids must be included in the diets

of animals. In the aromatic amino acid biosynthesic and is converted

converted to anthranilate during tryptophan biosynthesis and is converted

to playnthesis. Chorismate mutase catalyses the conversion of chorismate to

prophenate. Also disclosed are methods for selecting an isolated

polymucleotide that affects the level of expression of a tyrosine

polymucleotide that affects the level of expression of a tyrosine

consume enzyme polypeptide in a host cell. Obtaining a uncleic acid

fragment encoding a tyrosine biosynthetic enzyme polypeptide and

evaluating compounds for their ability to inhibit the activity of a

tyrosine biosynthetic enzyme. The polypeptides can be used produce

controlles. Chorismate mutase and prephenate dehydrogenase are good

targets for herbicides that will not affect animals, and overexpression

con these enzymes may be used to increase the content of aromatic animo

con these enzymes may be used to increase the content of aromatic animo

con these enzymes of those enzymes that may be used as herbicides. The

identify inhibitors of those enzymes that may be used as herbicides. The

concletic acids may be used to create transgenic plants, as probes for the

concletic and physical mapping of the genes and as markers for traits

conclusing the mutase protein #2

This invention describes a thore in which the shiking pathway has been altered relative to the wild type. The method involves a construct containing a plastid transit peptide, a chorismate mutase and/or prephenate dehydrogenase, linked to a least one regulatory sequence for transcription or translation in plants. The method is used to produce chemicals, particularly vitemains B or K and/or ubiquinone, useful e.g. as also aromatic amino acids, salicylic or folic acid derivatives, phenylpropanoids, flavanoids etc., especially in transgenic plants. Also plants with increased vitamin E contents have improved resistance to abiotic stress, e.g. frost and drought. Transgenic plants with an altered shikimate pathway are useful as foods, fodder and in preparation of processed foodstuffs. Transgenic plants with modified shikimate pathways have increased content of desired chemicals, particularly tocopherols and/or tocotrienols. This sequence represents the construct pCR-script/AtCM-ITP-ATCM-2 which is composed of the Arabidopsis thaliana plastid chorismate mutase-1 transit peptide and a Arabidopsis thaliana chorismate mutase-2 fragment and is used for plastid localisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        59 CGSLVEFVVKNTEALQAKAGRYKNPEENAFFPENLPPSIVPSYSFKQFLHPGAASININK 118

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       254
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    190 MKLLIFFISVEETVRKRVEKKAVVFGQEVNLNSDDNDNENR------KFDPSVASSLYK 241
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     10 DSGNVYTLASVREDLVRQEDTIIYGLIERAKFPSNSHTYDEKYAQIQGFCGSLVEFVVKAA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention discloses isolated polynucleotides encoding chorismate mutase polypeptides. Aromatic amino acids must be included in the diets of animals. In the aromatic amino acids must be included in the diets converted to anthranilate during tryptophan biosynthesis and is converted to prephenate, the branch point for tyrosine and phenylalanine biosynthesis. Chorismate mutase catalyses the conversion of chorismate to prephenate. Also disclosed are methods for selecting an isolated polymelectide that affects the level of expression of a tyrosine polymelectide that affects the level of expression of a tyrosine polymelectide in a host cell, obtaining a nucleic acid fragment encoding a tyrosine biosynthetic enzyme polypeptide and evaluating compounds for their ability to inhibit the activity of a tyrosine biosynthetic enzyme. The polypeptides can be used produce artibodies. Chorismate mutase and prephenate dehydrogenase are good targets for herbicides that will not affect animals, and overexpression of those enzymes may be used to increase the content of aromatic amino acid in food crops. The polypeptides may also be used to design and/or identify inhibitors of those enzymes that may be used to design and/or increase in an animal cand physical mapping of the genes and as markers for traits in the decident the dense and as markers for traits
Plant, enzyme, chorismate mutase, aromatic amino acid; diet, biosynthesis, chorismate, anthranilate, tryptophan, prephenate, tyrosine, phenylalanine, prephenate dehydrogenase, herbicide, food crop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New tyrosine biosynthetic enzyme, chorismate dismutase, proteins and nucleic acids, useful for facilitating design and/or identifying inhibitors of those enzymes that may be used as herbicides and for

The invention discloses isolated polynucleotides encoding chorismate mutase polypeptides. Aromatic amino acids must be included in the diets of animals. In the aromatic amino acid biosynthetic pathway chorismate is converted to anthranilate during tryptophan biosynthesis and is converted to prephenate, the branch point for tyrosine and phenylalanine biosynthesis. Chorismate mutase catalyses the conversion of chorismate to prephenate. Also disclosed are methods for selecting an isolated polynucleotide that affects the level of expression of a tyrosine biosynthetic enzyme polypoptide in a host cell, obtaining a nucleic acid fragment encoding a tyrosine biosynthetic enzyme polypeptide and

```
evaluating compounds for their ability to inhibit the activity of a tyrosine biosynthetic enzyme. The polypeptides can be used produce antibodies. Chorismate mutase and prephenate dehydrogenase are good targets for herbicides that will not affect animals, and overexpression of these enzymes may be used to increase the content of aromatic amno acid in food crops. The polypeptides may also be used to design and/or identify inhibitors of those enzymes that may be used as herbicides. The mucleic acids may be used to create transgenic plants, as probes for the genetic and physical mapping of the genes and as markers for traits linked to those genes. The sequence presented is a rice chorismate mutase
                                                                                                                                                                                                                                                                                                                                                                 CDQLMHILLTYETVERAIEHRVEAKAKIFGQEVDLGAEDNGAPPMYKIRPSLVAELYSYRI 240

The invention discloses isolated polynucleotides encoding chorismate mutase polypeptides. Aromatic amino acids must be included in the diets of animals. In the aromatic amino acids must be included in the diets converted to anthranilate during tryptophan biosynthesis and is converted to prephenate, the branch point for tyrosine and phenylalanine biosynthesis. Chorismate to prephenate. Also disclosed are methods for selecting an isolated polymptic enzyme polypeptide in a host cell, obtaining a mucleic acid fragment encoding a tyrosine biosynthetic enzyme polypeptide and evaluating compounds for their ability to inhibit the activity of a tyrosine biosynthetic enzyme polypeptide and evaluating compounds for their ability to inhibit the activity of a tyrosine biosynthetic enzyme. The polypeptides can be used produce antibodies. Chorismate mutase and prephenate dehydrogenase are good targets for herbicides that will not affect animals, and overexpression of these enzymes may be used to increase the content of aromatic and/or identify inhibitors of those enzymes that may be used to design and/or identify inhibitors of those enzymes that may be used as herbicides. The nucleic acids may be used to create transgenic plants, as probes for the genetic and physical mapping of the genes and as markers for traits of linked to those genes. The sequence presented is the protein encoded by a soybean chorismate mutase expressed sequence tag (EST)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 TEAIOAKAGRYKNPEENAFFPENLPPSIVPSYSFKQFLHPGAASININKSSGKYYFKELL 120

The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 5; SEQ ID NO 726; 261pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention discloses isolated polymucleotides encoding chorismate mutase polypeptides. Aromatic amino acids must be included in the diets of animals. In the aromatic amino acids must be included in the diets of animals. In the aromatic amino acid biosynthesis and is converted to anthramilate during tryptophan biosynthesis and is converted to prephenate, the branch point for tyrosine and phenylalanine converted to polymuchesis. Chorismate mutase catalyses the conversion of chorismate to prephenate. Also disclosed are methods for selecting an isolated polymuchetic arrayme polypeptide in a host cell, obtaining a nucleic acid fragment encoding a tyrosine biosynthetic enzyme polypeptide and a tyrosine biosynthetic enzyme polypeptide and cavaluating compounds for their ability to inhibit the activity of a tyrosine current biosynthetic enzyme. The polypeptides can be used produce antibodies. Chorismate mutase and prephenate dehydrogenase are good targets for herbicides that will not affect animals, and overexpression of these enzymes may be used to increase the content of aromatic amino caid in food crops. The polypeptides may also be used to design and/or identify inhibitors of those enzymes that may be used to design and/or caid in food crops. The polypeptides may also be used to design and/or identify inhibitors of those enzymes that may be used to design and/or nucleic and physical mapping of the genes and as markers for traits intended to those genes. The sequence presented is a corn chorismate mutase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    190 MKLLTFTSVEETVRKRVEKKAVVFGQEVNLNSDDNDNEN-RKFDPSVASSLYKNWVIPLT 248

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-MAY-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .1-MAY-
                                                                               RESULT 13
                                                                                               AAG060
                                                                                                                                     The invention discloses isolated polymucleotides encoding chorismate mutase polypeptides. Aromatic amino acids must be included in the diets of animals. In the aromatic amino acids must be included in the diets converted to anthranilate during tryptophan biosynthesis and is converted to prephenate, the branch point for tyrosine and phenylalanine biosynthesis. Chorismate mutase catalyses the conversion of chorismate to prephenate. Also disclosed are methods for selecting an isolated polymolectide that affects the level of expression of a tyrosine polymolectide that affects the level of expression of a tyrosine polymolectide in a host cell, obtaining a mucleic acid fragment encoding a tyrosine biosynthetic enzyme polypeptide in a host cell, obtaining a mucleic acid evaluating compounds for their ability to inhibit the activity of a tyrosine biosynthetic enzyme prephenate dehydrogenase are good tyrosine biosynthetic enzyme. The polypeptides can be used produce antibodies. Chorismate mutase and prephenate dehydrogenase are good tragets for herbicides that will not affect animals, and overexpression of these enzymes may be used to increase the content of aromatic animo acid in food crops. The polypeptides may also be used to design and/or identify inhibitors of those enzymes that may be used to design and/or increase and as markers for the genetic and physical mapping of the genes and as markers for traits in the account of acids may be used to create transgenic plants, as probes for the genes and as markers for traits
                                   Wheat; plant; enzyme; chorismate mutase; aromatic amino acid; diet; biosynthesis; chorismate; anthranilate; tryptophan; prephenate; tyrosine; phenylalanine; prephenate dehydrogenase; herbicide; food crop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       7

US-09-454-279-2

US-09-454-279-2

Sequence 2, Application US/09454279

Patent No. 6627798

GENERAL INFORMATION:

APPLICANT: Fanco, S. Carl

APPLICANT: Lee, Jian-Ming

TILLE OF INVENTION: AROMATIC AMINO ACID BIOSYNTHETIC ENZYMES

FILE REFERENCE: BB129 US NA

CURRENT FILING DATE: 1999-12-03

EARLIER APPLICATION NUMBER: 60/110,845

EARLIER APPLICATION NUMBER: 60/110,845

SOFTWARE: Milling DATE: 1999-12-04

NUMBER OF SEQ ID NOS: 22

SOFTWARE: Microsoft Office 97
